CineSense: ER diagram (Chen notation)

PostgreSQL 16 + pgvector. M:N relationships become the ratings and movie_genres tables; 1:N HAS becomes sessions.user_id.

CineSense: relational schema

Underlined = primary key (two underlined = composite key). Arrow = foreign key, pointing to the primary key it references (all ON DELETE CASCADE). rating_audit has no foreign keys on purpose, so its history survives deletes. movie_details is a view (derived), not a table.
